Multiplexing and Multiplexer

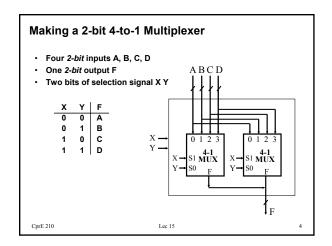

- Multiplexers are circuits which select one of many inputs
- In here, we assume that we have one-bit inputs (in general, each input may have more than one bit)
- Suppose we have eight inputs: I0, I1, I2, I3, I4, I5, I6, I7
- We want one of them to be output based on selection signals
- 3 bits of selection signals to decide which input goes to output
- Note the order of selection signals

Multiplexer Implementation · We can write a logic expression for output F as follows F = X' Y' Z' I0 + X' Y' Z I1 + X' Y Z' I2 + X' Y Z I3 + X Y' Z' I4 + X Y' Z I5 + X Y Z' I6 + X Y Z I7 This circuit can be implemented using eight 4-input AND gates and one 8-input OR gates XYZ F 0 0 0 10 0 0 1 11 0 1 0 0 1 1 1 0 0 1 0 1 1 1 0

Lec 15

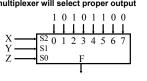

Synthesis of Logic Functions using Multiplexers

- · Multiplexers can be directly used to implement a function
- Easiest way is to use function inputs as selection signals
- Input to multiplexer is a set of 1s and 0s depending on the function to be implemented
- We use a 8-to-1 multiplexer to implement function F
- Three select signals are X, Y, and Z, and output is F
- Eight inputs to multiplexer are 1 0 1 0 1 1 0 0
- Depending on the input signals

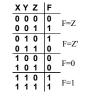

CprE 210

- multiplexer will select proper output

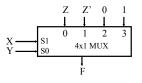

Implementing 3-variable functions with 4x1 MUX

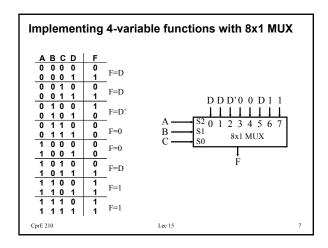

- · Divide the outputs into 4 groups based on X and Y.
- Write the outputs as a function of Z
- There are only 4 possibilities: F=Z, F=Z', F=0, F=1

Definition of Encoder

2-to-4 Decoder The 2-to-4 decoder is a block which decodes the 2-bit binary inputs and produces four outputs One output corresponding to the input combination is a one Two inputs and four outputs are shown in the figure The equations are y0 y0 = x1'. x0' $x1_{\underline{}}$ → y1 2-to-4 y1 = x1'. x0 → y2 decoder y2 = x1 . x0' x0. y3 -y3 = x1.x0· The truth table: x1 x0 y3 y2 y1 y0 0 0 0 0 0 1 0 1 0 0 1 0 1 0 0 1 0 0 1 1 0 0 0 CprE 210 Lec 15 11
